

I. Wiring diagram for selection and procurement of peripheral equipment

Equipment name	Functions
Wiring circuit breaker	Protect power supply system upon short circuit accident
Contactors	Direct connection/disconnection between power supply and frequency converter
Input AC reactor	Increase power factor of input power supply, reduce high order harmonics, suppress surge on frequency converter power supply equipment
DC reactor	Improve or suppress distortion of grid voltage/current waveforms due to filtering capacitor charging/discharging pulse current, and reduce harmonic contents, to improve grid power supply quality
Output AC reactor	Used for smoothed filtering, to reduce transient voltage at motor end with long wire connection, extend motor service life, and suppress motor noise grade vibration and difference mode noise at frequency converter output measured within 100kHz
Restraint unit	Control rise of bus voltage, to protect the frequency converter to some extent; when frequent restraint is required, improve restraint capacity of frequency converter
Restraint resistor	Consume motor braking process mechanical energy in the form of heat via the restraint resistor and can shorten speed reduction time of the frequency converter drive system

II. Circuit breakers and contactors
